

PACAP (1-38), Human, Ovine, Rat

Kojro et al. observed that the PAC1 agonists PACAP-27 and PACAP-38 strongly increased the activity of γ -secretase. Upregulation of this APP-degrading enzyme promotes the non-amyloidogenic processing of APP, i.e. reduces the production of A β 40/42, and thus may help to prevent Alzheimer's disease. Nasally applied PACAP-38 in APP[V717I]-transgenic mice additionally enhanced the production of the A β -degrading enzyme neprilysin via induction of somatostatin.
