

Modified Collagen Fiber & Elastic Fiber stain kit (Van Geison & Verhoeff method)

Collagen fiber is the most widely distributed fiber in connective tissue. Elastic fiber is mainly distributed in the arterial wall, alveolar wall and skin of the human body. It is yellow when fresh and has strong refractive index. In routine tissue staining, it is often necessary to display two types of fibers at the same time to study the coexistence relationship between fibers and their dependence on other structures. Based on this, the EVG composite staining kit was produced on the basis of the fiber single staining kit, which is a combination of conventional elastic fiber staining and collagen staining.

This kit uses a combined staining mechanism of Van Geison & Verhoeff stain solution, which can stain elastic fibers and collagen fibers simultaneously on a slice, and is not easy to fade. After staining, elastic fibers are blue, collagen fibers are red, and muscles are yellow-green. It is suitable for observing whether there are abnormal lesions in elastic fibers and collagen fibers in tissues, thereby assisting in diagnosis. This kit is of high quality, does not contain picric acid, is easy to operate, has stable staining, and bright and clear colors.

Catalog No.	261053
Size	3 x 50mL
Product Category	Histochemical Stain
Storage/Stability	Ambient/1 year
Shipping	Ambient
