

SABC (Goat IgG-FITC) kit

Streptavidin-Biotin Complex (SABC) kit is specially designed for displaying the distribution of antigens on tissues and cells in immunochemistry and other immunodetection analyses. Streptavidin is a 47,000 Dalton protein purified from the bacterium *Streptomyces avidinii*. Streptavidin has extraordinarily strong affinity to biotin molecules. The dissociation constant (Kd) of the biotin-Streptavidin complex is on the order of $\sim 10^{-15}$ mol/L, a million times higher than the typical affinity between antigens and their antibodies. Streptavidin has very low non-specific binding to tissues and cells, due to its nearly neutral isoelectric point (pI=6.0~6.5). Therefore, immunohistochemical analyses based on Streptavidin-biotin complex has extremely low background. Furthermore, this kit has high sensitivity because each complex it generates has a large number of alkaline phosphatase and Streptavidin molecules. In brief, SABC offers high specificity, low background and ease-of-use.

Note: Goat IgG refers to the host of the primary antibody, not the origin of the specimen. This kit should be used on primary antibodies from Goat; the components supplied in this kits are sufficient for 100-200 assay.

Kit Components:

- 1) Biotinylated Rabbit anti-Goat IgG: 100uL
- 2) FITC-Streptavidin concentrate: 100uL
- 3) BSA Blocking Buffer (5%): 10mL
- 4) Dilution buffer: 30mL
- 5) Mounting Medium (antifading): 10mL

Catalog No.	505302
Size	
Product Category	Immunodetection Reagent
Storage/Stability	-20°C / 1year
