

Goat anti-Human IgM

The serum obtained by immunizing a host animal is called immune serum or antiserum. This process involves introducing an antigen (the immunogen) into the animal, which then triggers an immune response, leading to the production of antibodies against the antigen. The serum, collected by bleeding the animal, contains these antibodies and can be used for various applications, such as transferring passive immunity or in research and diagnostic tests.

The appearance of this product is reddish transparent liquid, containing 0.01% NaN₃ for corrosion protection.

Catalog No.	418103
Size	0.5mL
Product Category	Immune Serum
Immunogen	Human IgM purified from human plasma
Host	Goat
Application	Human
Recommended Dilutions	WB; ELISA; Double Immunodiffusion
Storage/Stability	WB: 1:2000-20000; EIA: 1:2000-50000; ID: 1:8-64
Shipping	-20°C/1 year
