

Eosin Y staining solution

The Eosin staining solution is easy to operate and does not use toxic reagents such as mercury or methanol. It can be used for staining tissue sections or cultured cells. Eosin is an acidic biological dye, often used for staining the components in the cytoplasm and extracellular matrix.

This staining solution can be used in conjunction with immunofluorescence staining or immunohistochemical staining. The staining process needs to be optimized. The staining situation is related to the type of tissue or cell, and also changes with its life cycle and pathological changes. This product is a working fluid and can be used directly.

Catalog No.	261012
Size	125mL
Product Category	Histochemical Stain
Storage/Stability	Ambient/1 year
Shipping	Ambient
